The process of giving off of water vapour by evaporation through the aerial parts of a plant is termed as transpiration.

1. What is the structure of the plants where transpiration occurs most abundant?
2. What are the advantages to the plant due to the transpiration?
3. What are the environmental factors affect for transpiration?
4. Show with the examples adaptations of plants for water conservation in arid environments.

Study 11.6 activity of the text book.

5. What happens water level of the pipette which is connected to the free end of the "U" tube?
6. What is the reason for that?
